## Instructions for Installing the Vista v2 OSX Package

These instructions outline the procedure for installing Vista v2 on a MAC. Note: Users must have full read/write access to install and run the application.

The Vista v2 software can be installed on an Apple Mac running OSX Snow Leopard or later.  
Installation overview

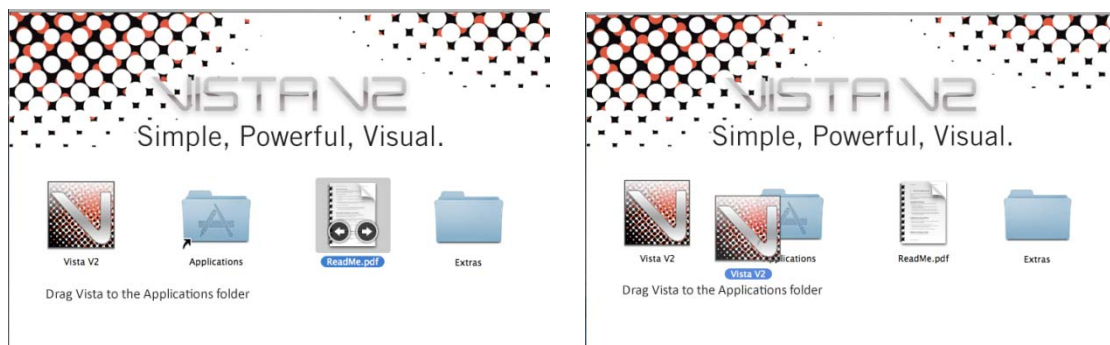

### Procedure:

Installing the Vista software for the first time involves the following steps:

- Installing the Vista application
- Installing the Sentinel Runtime environment (only required if you have purchased a Vista licence dongle)
- Setting a location for your VistaData folder. Your show files, modified fixture files and any other user generated data will be stored in this folder.

Note: If you are updating an existing version of Vista with a build number of 11191 or lower please read the 'Updating from v2.2.11191 or earlier' section carefully.

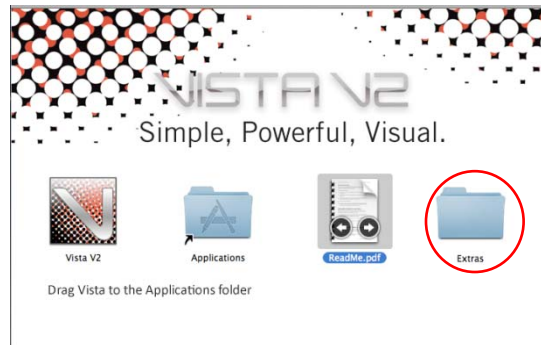

1. Download the OSX installer package from <http://jands.com/support-vista-v2/download/> to the PC.
2. Close all open applications.
3. Disconnect/switch off all Jands Vista USB devices.
4. Double click on the downloaded Byron\_OSX\_Installer .dmg file to open the installer window on your desktop.
5. Drag the Vista v2 icon to the Applications folder shortcut.

6. In the Applications folder on your hard disk open the Vista V2 folder and double click the Byron icon to launch the software.
7. Follow the on-screen instructions to set up Vista for the first time.

## Additional software installs

The 'Extras' folder contains the following software:

## Sentinel Runtime.dmg

If you have a Vista licence dongle and this is the first time you have installed Vista you must install the Sentinel software. You do not need to install the software if you are using Vista in demo mode.

To install Sentinel Runtime:

1. Double click on the 'Extras' folder to open the Sentinel Runtime window on your desktop.
2. Double click on the 'Install Sentinel Runtime environment' icon to start the installation.
3. Click 'Continue' when you see a message saying "This package will run a program to determine if the software can be installed....."
4. The software will be installed.

*Note: If you see an alert message that "Sentinel Runtime can't be installed on this computer." it indicates the software has already been installed. If you want to re-install you must uninstall the existing version first.*

## Setting the location for your data

When you run Vista v2 for the first time you must choose a location for your VistaData folder. Your show files, modified fixture files and any other user generated data will be stored in this folder. To do this:

1. In the Applications folder on your hard disk open the Vista V2 folder and double click the Byron icon to launch the software. Vista will open the 'Choose a location for your VistaData folder' window.
2. Navigate to the location you want to use. The recommended location is /Users/yourusername/
3. Click 'Choose' to set the location. Vista creates a new folder (VistaData) in the location you selected in step 2
4. Vista will open.

## Updating from v2.2.11191 or earlier

If you are already using Vista v2 (Byron) version 2.2.11191 or earlier be sure to make a backup copy of your 'UserData' folder. This folder is normally located inside the Vista2 folder which is inside your Applications folder (/Applications/Vista2/UserData).

The latest installer does not overwrite or replace any files in this folder and it will still be usable after the new version is installed.

To update from v2.2.11191 or earlier follow these steps:

1. Make a backup copy of your 'UserData' folder.
2. Install the new Vista software (see Installing the Vista software above)
3. Locate the new Vista V2 folder, inside the Applications folder. Open it and double click the Byron' icon to launch the program.
4. When the new version opens, it will search for your UserData folder and if it is currently located inside the Vista2 folder the installer will copy all files to the location you choose. The recommended location for the new VistaData folder is inside your user folder (i.e. /Users/yourusername/)
5. Note: If you have a Vista v2 (Byron) icon on your Mac Dock it will still open the old version. You should delete it and add a new shortcut by first locating the new Vista V2 folder, inside the Applications folder, then dragging the Byron application icon to the dock.
